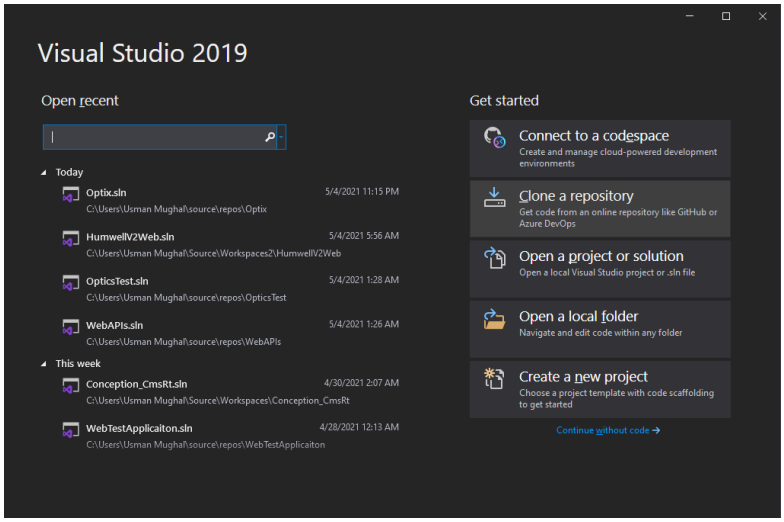
Clone Repositories in Visual Studio 2019

Visual Studios gives us many features also have Repository system which we can directly access from visual studio no other software required

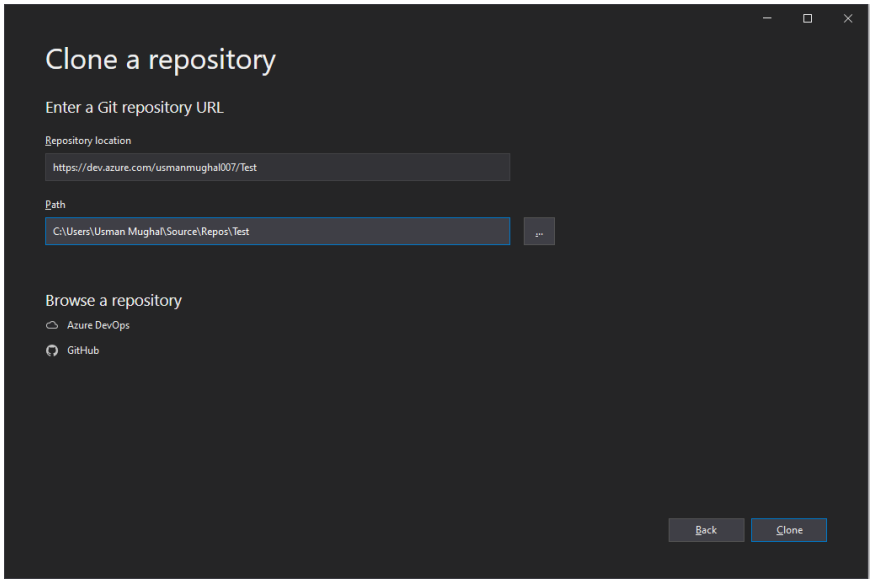
Here you can manage you all projects in simple way

Let's start with Repository with Azure Dev Ops Technology

1. Open your Visual Studio
2. On the first screen Press Clone Repository button right side of your window

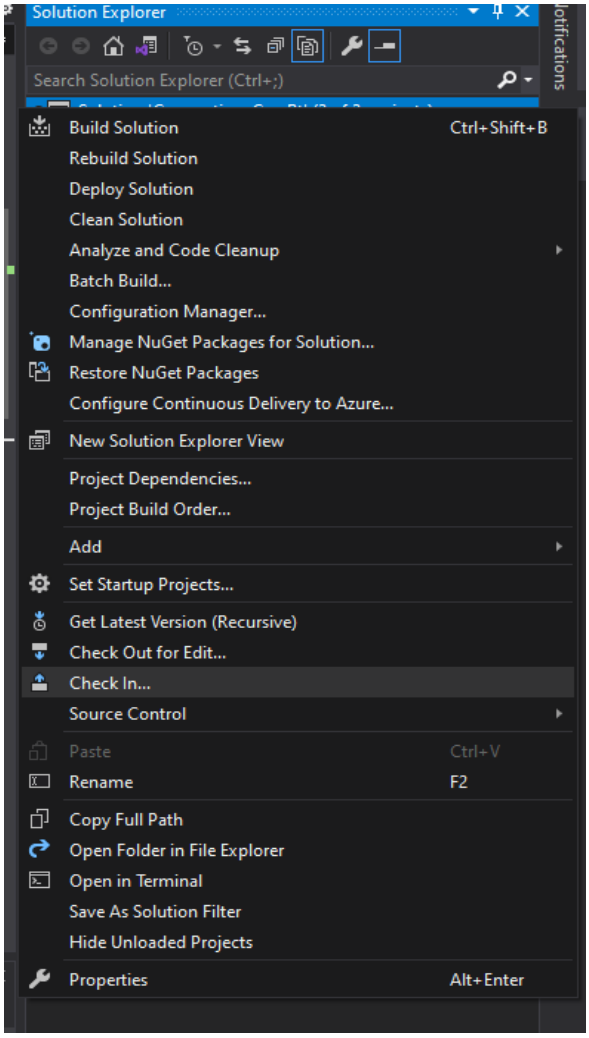


3. Enter URL or Browse Repository to access



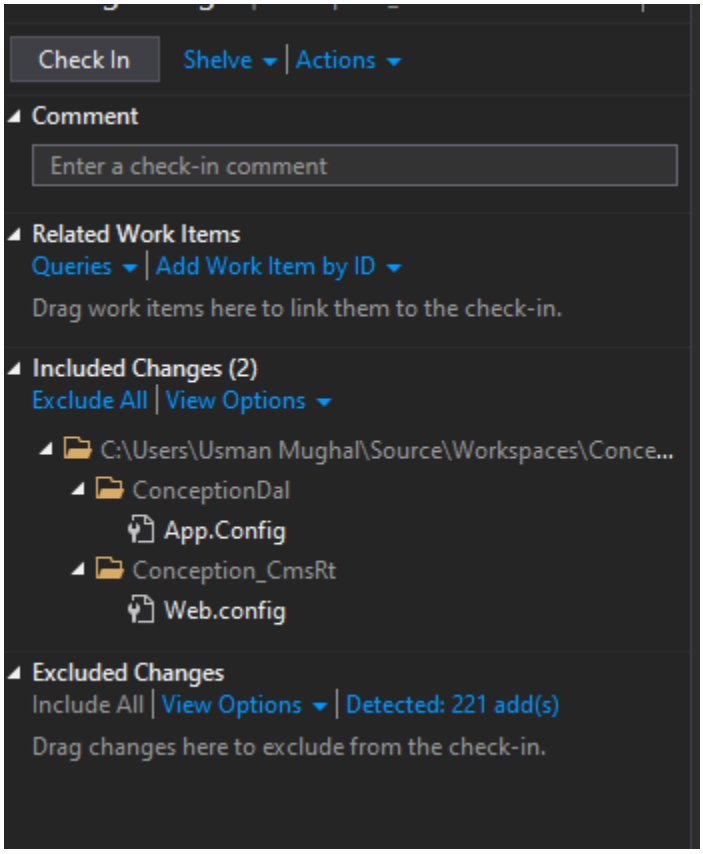
Usman Mughal(Usman.mughal@learninginz.com)

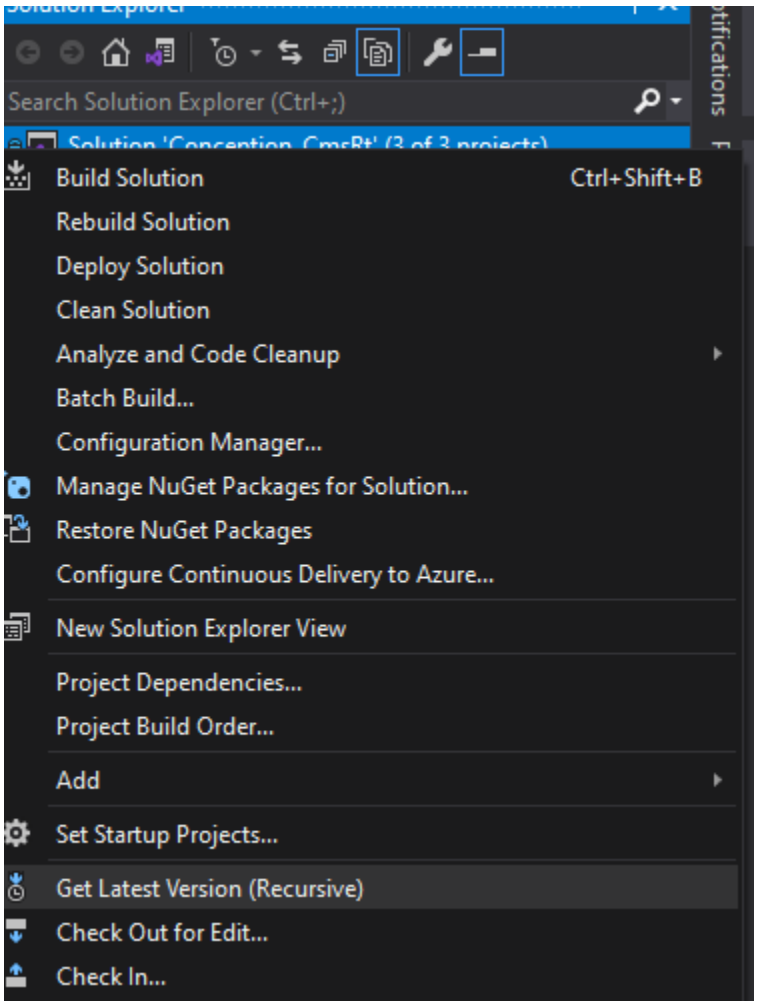
4. Wait for cloning the project
5. After clones yours project Lets start the work
6. After changes in project, you also have to push it back. so, the other members can integrate your changes
7. Open Team explorer in View Tab
8. Right Click on your project and press Check In



9. You will see the classes where you made changes

10. And here you can exclude your changes Like you change a connecting string to run the software in you Pc but when you have to PUSH your project you have to change back connecting string. so, in this case you can exclude Connection string file and push other classes to Cloud
11. Right click on class and press exclude.
12. You can also write **comments** in **comment section** box to Rectify which change you made



13. It will take some time and will upload on cloud
14. Always Remember when you are working with **team** using **Repositories.**
15. ALWAYS Get latest version of you project from **Cloud**


16. Right Click on Project and Press **Get Latest Version**
17. Wait for Finish **Downloading**
18. And then **start** the change
